

I availed the opportunity to hear valuable speeches of 6 key note speakers who shared their current research update in the symposium. I had an oral presentation entitled “Development of silkworm infection model for *Francisella novicida* pathogenesis study”. I also listened other presenter’s talk of different Universities. Discussion with different key note speakers, oral and poster presenters have extended my research knowledge. Hard work and enthusiasm of young researchers towards veterinary research inspired me to do more work. Interaction with researchers will help to imagine a new area of collaboration in near future. The morning of the departure date I visited the Changdeokgung Palace (historical place) with Dr. Hiroshi Sato sensei and other students of UGSVS of Yamaguchi University. Overall, it was a nice experience for me to introduce with Korean culture, I enjoyed & learned a lot during the symposium, and also felt motivated to do hard work.

Finally, I want to express my deep gratitude UGSVS of Yamaguchi University for providing the opportunity to present my research topic in the symposium.
